

AI exposure findings

Example Organisation · 2026-09-01 to 2026-10-01

On 27 occasions, an unmanaged AI application was brought to the front while sensitive content was still on the clipboard.

WHAT WAS EXAMINED

Activity on the assessed machines was examined for sensitive content leaving the organisation through AI tools: what was detected and withheld, what was refused by policy, and occasions where sensitive content and an unmanaged AI application were present at the same moment.

Masked before being sent (times sensitive details were masked)	412
Requests refused by policy	9
Occasions of simultaneous exposure	27

HOW TO CHECK THIS

Every figure above is drawn from a tamper-evident record held on the assessed machines. It can be exported and verified independently, without contacting the assessor and without the assessed software running.

COVERAGE LIMITATION, READ BEFORE THE FIGURES

Model calls: recorded for 24 of 30 days. Figures drawn from a partially recorded category are printed as observed, with the number of days they cover, and their direction is withheld rather than estimated. A zero in such a row would mean the category was switched off, not that nothing occurred.

Generated on this device from its own records. Nothing in this document was uploaded, and producing it required no connection to Sparcle.
